

So the goal with my new app is to make a demo. But for yourself as a, as, you know, you are the product. If somebody, if you walk up to somebody and you're trying to get them to believe in your idea, you pull up the application, you show them, you know, all of your skills. Or not your skills, but you show the apps, tools, functionality, use case, necessity, the problem it solves. Who is the who you're solving the problem for? And you're showing like, the depth of your understanding of the product and the market you're trying to sell it to. Um, all in a matter of a couple minutes, 30 seconds, one minute. And I think of it like, when you go and you look for employment somewhere, We all sending in a resume. CV letter. Um, CV. You need to stand out. In one way or another. And the way I want this app to function is I want it to be, uh, uh, you alive. Your CV coming alive, your resume coming alive. And you just haven't access to your entire brain. Your repertoire, your history, things you've learned, in a vessel that also looks like you know what you're talking about. If you deal with technology, if you're somebody who has multiple skills, It's hard to make a sound system that illustrates how these skills may be coming from other areas of life that don't obviously translate. into, you know, a specific job, you know, app uh, uh, interview process, a specific opportunity for something that's, you know, That has finite responsibilities and things of that nature you want. All of these things that you've done in life and experiences you've had to be able to be seen, like, you want the app to speak the words for you, and you want to just say a bit, yes, this is what I've accomplished. Um, I've studied trading, I've studied IT, I've studied cyber security. Um, I've studied, You know, whatever it is, and then you want to show it from there, you know. So when you say IT, you want to expand on IT. Here's these bullets. If you click trading, you want to show, here's these bullets. I wasn't just trading. I made bots. Here's an image of a bot. Here's of, like, a vessel where you can see the things that I created. And it's just a click away. Boom, boom, boom. 30 seconds, you can see everything I've done. And it doesn't take a PDF. It doesn't take, you know, uh... Like, if you imagine you send in to a hiring manager in P45. With a screen recording of everything you've done. And you know, and you're speaking over it, showing your skill sets. And just you just did it in a Zoom car. That you kept. This is beautiful. You don't even have to pay Zoom. You can do it in a matter of five minute call, which is within the free limit. Um, that's... That's what's missing. People don't have a cool way to illustrate their resume and the people that do have a cool way of illustrating their resume already marketable, you know? Like, when, like, if I come and show them that I design this app for people to be able to display their talents. That makes me pretty marketable, just taking that initiative. And, you know, if I have what makes them comfortable, then I can get things done. But regardless, the customer will have this, it'll be never before seen, for the next 2 years, every time somebody sees it, it'll be their first time seeing it. and you're gonna start

seeing people sending MP4s to hiring managers, instead of just constantly sending 200 fucking, you know, CVs, resumes, and trying to tweak and change, and you know, you're not about to tweak and change the shit 2 to 400 times. You know you won't. We all gonna pretend we are. There might be a few that are crazy enough to do it. Or enough time passes that you did do it. Even though sometimes you were lazy, you still ended up doing it, you know? Which is, none of these cases are optimal, so, in a market that is unforgiving, let's try some new stuff, and I love to, just get some people using it. Um, get a, give them an opportunity to display their work, but I have to just make it the ease of, What do you want this to look like? Grab some screenshots, grab some project documents, grab some, you know, spreadsheets with all your numbers on it, grab some, grab whatever you have that would say, I have integrity. We'll worry about making it presentable. And that's the extent of my idea. So, in summary, since I've said all that, this is practice for me to talk about this. In summary, this application is essentially, you have skills, you have history, you have files, you have records of everything you've done. Instead of you spending days and weeks trying to registrate this... textbook, but I grabbing PowerPoint, CV, cover letter. resume, unique to every place you go. You open up a Zoom call. You open up the app. Start recording. You just, you display all of the things that you have as files. You upload them there. The application will make it presentable. You start recording. I did this skill. These are the highlights, images that I did with that skill. This is the next skill. These are the highlighted things I've done with that skill. I did this skill. These are the highlighted things I've done with that skill. Go to the homepage. This is the biggest achievements I've ever created, you know? Then, you get to be done, everything that you've done, is shown, whether you have the articulation skills to explain quickly. You have in 2 minutes. Everything that you needed in a resume, everything that you wanted to show in this way, when you send directly to a hiring manager, you're not sending the same thing that's going through a filter. Um, when you send regular job applications in. So, I think it's, I think it's a step in the right direction. I don't see anyone doing this. So, yeah. And that took me about a minute and a half or two to explain. But I would cut out the part where I say, you know, open zoom and all that. No, really? It's just you have your data, your information, everything that you have in a Google Drive, on your fond of windows, on your windows, explore. I mean, on your file, Explore. You have all that. Instead of going and designing a PowerPoint. We make it presentable for you. You have a prompt space, if you have any specifications that you desire. Really, most people are done to go on here and they're gonna try it and see what it outputs, and then they're gonna see if they can curate it. And then they're gonna tell me whatever issues they're having with the application. But in the meantime, in between time, that person that's trading and, and that person that's doing IT projects and that person

that's doing, you know, different, Engineering projects. You have a way of displaying it now. You have a way to go into an end, and then also you have an engine where you're, everything that you have is being dumped into, orchestrated, calibrated in ways that you've always been curious about. Like, I wonder if I put all these files together. Can I extract some graphs? Can I extrapolate some personal skill set metrics? Can I extract some, you know, Like, a bird's eye view of what I've been doing, have I been a bit leaned in one direction too hard, has a, have a, do I have any blind spots? You know, things of that nature, because a lot of people couldn't just go to college and be, you know, go through a specific system that make, that makes them just fit into what people find is comfortable to hire to, you know, manage and collaborate with. So, this gives you a way to curate yourself into a systemic environment. Systems are not supposed to be hard. They're supposed to be impactful. They're supposed to be modular. Like, if I have a system that works today, the world could change the next week, and I need to be able to plug and play. I need to be able to take something out, place it. I need to be able to see it. I need it to be the least amount of steps so that when something happens, I'm only going through a few things rather than 20 things. to decipher whether it still needs to belong or if it needs to be edited or if it, you know, is the new cutting edge for me. So, yeah, so the systems angle, the, we will make it presentable for you angle. And the speed of presentation. And the usability, the environment, the flow state of the UI, which I think that's kind of, I want that to be the, The unspoken part. Like, we're not gonna talk about how beautiful that is. You're gonna see that, the person who's looking at the videos that you're sending is gonna see that. That's great. But, That is just gonna be the attention. The attention that is kept throughout the one minute and a half , 2 minutes, that you are presenting your skills in. Now, my challenge right now is figuring out. how to communicate that in a way that is just seamless. Like, you get on here, everything that you end up doing, everything that you're encouraged to do, everything that pings, everything that lights up, everything that triggers as you operate. leads you to this outcome, whether you realized it or not. It should be. You shouldn't have to get an explanation for what is capable of before you get into using it.
